Supplementary Figure S1. Changes of single retinal layer thickness of senior elite athletes over time following cycle ergometer strain.
Data are shown in the total macular area (T), the central subfield (C), the inner (I) and outer ring (O). *: $p < 0.05$ (missed significance), **: $p < 0.001$ (significant). The $p$ values indicate the results of the post hoc Dunnett test in the case of significant (bold) or missed significant (tilted #) ANOVA test. For mean and SD values see Table S2. (For the abbreviations of the layers see Figure 1.)
