Supplementary Figure S1

The LOFUS cutting machine © The authors.
Note. The development of the LOFUS cutting machine was inspired from the Norwegian Trøndelag Health Study (www.HUNT.no). It was used for simultaneous cutting of up to five rolls of adhesive film that was used in all four attachment protocols (Table 1). The machine was mounted on the edge of a table with a clamp. The rolls were placed on the sticks, and a hobby knife was used to cut the correct length of the adhesive film on the plate. The machine was manufactured by the father of the first author.
